

DAVEY Brushwood supplies and installs high density Brushwood panels throughout Western Australia, whether it's gates, fencing or roofing we can provide the best choice for your transformation.

Brushwood is compressed at extreme pressures between high tensile wires, the critical factor in ensuring the longevity of the product and subsequently we are able to provide an evenly distributed panel with weights of up to 100 kilos.

The installation is typically directly into soil by using 2.4m long galvanised steel posts every two meters connected together by a 30mm galvanised steel angle, the panels are wired between the posts using the eight 2.5mm galvanised steel wires on either side of the panel with the steel frame covered by a brushwood capping.
